dist_areas_f	<i>Distances between hexagonal bins</i>
--------------	---

Description

Distances between hexagonal bins

Usage

```
dist_areas_f(
  U,
  delta = (range(U$x)[2] - range(U$x)[1])/100,
  h = neighbourhoods(U, delta)
)
```

Arguments

U : a dataframe containing the numerical variables x and y and preferable hexagon

delta : needed if hexagon is not a variable of U: bins will be recomputed

Value

a named matrix

Examples

```
data(U)
dist_areas_f(U)

delta<-0.01
h<-neighbourhoods(U,delta)
U$hexagon<-paste0(h@cID)
hD<-dist_areas_f(U,h)

sss1=sample(nrow(U),1000)
sss2=sample(nrow(U),1000)
x=sapply(1:1000,function(i){dist(U[c(sss1[i],sss2[i]),c("x","y")])})
y<-sapply(1:1000,function(i){hD[U$hexagon[sss1[i]],U$hexagon[sss2[i]]]})
plot(x,y,pch=".")
```

Generate_U

*Generate spatial data that matches population counts***Description**

Generate spatial data that matches population counts

Usage

```
Generate_U(SpatialData, .id = NULL, .spatialobject, type = "random")
```

Arguments

SpatialData : an object of class that includes
type : argument to be passed to `sp::spsample`

Examples

```
data(parish110217popest, package="dataONS")
data("mtcty150217population", package="dataONS")
shapeData2<-dataONS::dataParishes_December_2011_Boundaries_EW_BFC()
yy<-unique(get(data(Output_Area_to_Parish_to_Local_Authority_District_December_2011_Lookup_in_England_and_Wale
names(yy)<-tolower(names(yy))
shapeData<-sp::merge(shapeData2,yy,by="par11cd",duplicateGeoms = TRUE)
parish110217popest2<-parish110217popest[
  is.element(parish110217popest$PAR11CD,
             shapeData$par11cd)&
             parish110217popest$year=="mid_2006",
             c("PAR11CD", "Population")]
names(parish110217popest2)<-tolower(names(parish110217popest2))
shapeData=sp::merge(shapeData,parish110217popest2,by="par11cd",duplicateGeoms = TRUE)
shapeData$population[is.na(shapeData$population)]<-mean(shapeData$population,na.rm=TRUE)
shapeData<-subset(shapeData,is.element(lad11nm,c("Allerdale", "Barrow-in-Furness", "Carlisle", "C

U<-Generate_U(shapeData,.id="par11cd",.spatialobject="st_areasha",type="random")
popbins<-quantile(shapeData$population,(seq_len(11)-1)/10)
poppal <- colorBin(heat.colors(5), bins=popbins, na.color = "#aaff56",reverse = T)
library(leaflet)

leaflet(U) %>%
  addPolygons(data=shapeData,
              stroke=TRUE,
              weight=1,
              color="black",
              fillOpacity=5,
              fillColor=~poppal(shapeData$population)) %>%
  addTiles() %>%
  addLegend(title = "Population count", pal=poppal,
            values=shapeData$population,
```

```
opacity=1,
na.label = "Not Available")
```

neighbourhoods	<i>hexagonal bins</i>
----------------	-----------------------

Description

hexagonal bins

Usage

```
neighbourhoods(
  U,
  delta = (range(U$x, na.rm = TRUE)[2] - range(U$x, na.rm = TRUE)[1])/100
)
```

Arguments

U : a dataframe containing the numerical variables x and y
 delta: controls the bin diameter

Value

a hexbin object hexagonal bins

Examples

```
# plot the hex bins of cumbria
data(U)
plot(neighbourhoods(U,.002))
```

risktobeinfectedbydistancetoallinfectedunit	<i>Risk to be infected by many neighbours a neighbour at a certain distance</i>
---	---

Description

Risk to be infected by many neighbours a neighbour at a certain distance

Usage

```
risktobeinfectedbydistancetoallinfectedunit(
  .dist,
  nI,
  .distriskhalf = 5 * 10^(-4),
  jumprisk = 10^-6
)
```

Arguments

.dist : a vector (distances)
 .disthalfrisk : distance for which the risk is one half
 nI: total number of infected
 jumprisk: probability to be infected by one person, no matter how far he/she is

Value

$1 - (\text{prod}(1 - \text{risktobeinfectedbydistancetooneinfectedunit}(\text{.dist}, \text{distriskhalf})) * (1 - \text{jumprisk})^{nI})$

Examples

```
#Risk to be ingfected 2 m from the victim when the 50%risk distance is 1 m:
risktobeinfectedbydistancetooneinfectedunit(2,1)
```

```
risktobeinfectedbydistancetooneinfectedunit
```

Risk to be infected by a neighbour at a distance x

Description

Risk to be infected by a neighbour at a distance x

Usage

```
risktobeinfectedbydistancetooneinfectedunit(.dist, .distriskhalf = 5 * 10^(-4))
```

Arguments

.dist : a distance
 .disthalfrisk : distance for which the risk is one half

Value

$\exp(-\text{.dist}/(\log(2) * \text{distriskhalf}))$

Examples

```
#Risk to be ingfected 2 m from the victim when the 50%risk distance is 1 m:  
risktobeinfectedbydistancetooneinfectedunit(2,1)
```

test	<i>runCompare</i>
------	-------------------

Description

Shiny App to

Usage

```
test()
```

Examples

```
package1<-NULL  
package2<-NULL  
runCompare()
```
