addpiechartclustermarkers

Change leaflet cluster markers to pie charts

Description

Change leaflet cluster markers to pie charts

Usage

```
addpiechartclustermarkers(map, .data, .colors, group)
```

Arguments

map the map to add awesome pie chart cluster markers to

.data data for the cluster markers

. colors a vector of colors of at least the same size that nlevels(.data[[group]])

group the name of a factor variable of .data

Examples

```
data("breweries91",package="leaflet")
breweries91$goodbear<-sample(as.factor(c("terrific","marvelous","culparterretaping")),nrow(breweries91),replac
library(leaflet)
library(dplyr)
leaflet() %>%
addTiles() %>%
```

distpointtoseg

computes the distance between a point and a segment

addpiechartclustermarkers(breweries91,.colors=c("red","green","blue"),group="goodbear")

Description

computes the distance between a point and a segment

Usage

```
distpointtoseg(p, s)
```

distsegmenttopoly 3

Arguments

p a numeric vector of length 2 s a 2x2 numeric matrix, representing a segment. Each row of the matrix are the

coordinates of a extreme point of the segment.

Examples

```
 \begin{split} & zz <- function(p) \{ \\ & s = matrix(c(0,3,0,0),2,2) \\ & plot(s,type="l",xlim=c(-2,5),ylim=c(-2,2)) \\ & points(x = p[l],y = p[2],col="red",cex=.5) \\ & points(projpointonseg(p,s)[l],projpointonseg(p,s)[2],col="red",cex=.5) \\ & segments(x0 = p[l],y0 = p[2],x1 = projpointonseg(p,s)[1],y1 = projpointonseg(p,s)[2],col="red") \\ & text((projpointonseg(p,s)[1] + p[1])/2,(projpointonseg(p,s)[2] + p[2])/2,round(distpointtoseg(p,s),2)) \} \\ & par(mfrow = c(3,3)) \\ & set.seed(1);replicate(9,zz(c(sample(-2:3,1),sample(-2:2,1)))) \\ \end{split}
```

distsegmenttopoly

Distance between a segment and a polygon

Description

Distance between a segment and a polygon

Usage

```
distsegmenttopoly(s, .poly)
```

Arguments

s a 2x2 numeric matrix, representing a segment. Each row of the matrix are the

coordinates of a extreme point of the segment.

.poly a polygon (a nx2 matrix, each line is a point)

```
data(Avo_fields,package="Strategy")
polygon1<-Avo_fields[1,]
A<-polygon1@polygons
B<-A[[1]]@Polygons[[1]]@coords
s<-cbind(runif(2,min = min(B[,1]),max=max(B[,1])),runif(2,min=min(B[,2]),max=max(B[,2])))
plot(B,type='l')
s1<-s
points(s,type="l",lwd=4,col="green")
x<-vector()
for(i in 1:(nrow(B)-1)){
s2<-B[(i:(i+1)),]
dd<-distsegmenttosegment(s1,s2)</pre>
```

```
l<-which(c(distpointtoseg(s1[1,],s2),distpointtoseg(s1[2,],s2),distpointtoseg(s2[1,],s1),distpointtoseg(s2[2,]
min(as.matrix(dist(rbind(s1,s2),diag=T,upper = T))[3:4,1:2]);dd
sk<-if(l<=2){s2}else{s1}
p=rbind(s1,s2)[1,]
points(x=p[1],y=p[2] ,col="red",cex=2)
points(projpointonseg(p,sk)[1],projpointonseg(p,sk)[2],col="red",cex=2)
segments(x0 = p[1],y0=p[2],x1=projpointonseg(p,sk)[1],y1=projpointonseg(p,sk)[2])
x=c(x,dd)
}
min(x)
distsegmenttopoly(s,B)
distpolytopoly()</pre>
```

distsegment distance segment to segment

Description

distance segment to segment

Usage

```
distsegment(s1, s2)
```

Arguments

- a 2x2 numeric matrix, representing a segment. Each row of the matrix are the
 - coordinates of a extreme point of the segment.
- s2 a 2x2 numeric matrix, representing a segment. Each row of the matrix are the

coordinates of a extreme point of the segment.

Value

a number

```
zz<-function(){
s1=matrix(sample(0:4,4,rep=T),2,2)
s2=matrix(sample(0:4,4,rep=T),2,2)
s<-rbind(s1,s2)
dd<-distsegmenttosegment(s1,s2)
plot(s,cex=.5,main=paste0("Distance: ", signif(dd,3)),asp=1,xlim=range(s),ylim=range(s))
points(s1,type="1",lwd=4,col="green")
points(s2,type="1",lwd=4,col="blue")
if(dd>0){1<-which(c(distpointtoseg(s1[1,],s2),distpointtoseg(s1[2,],s2),distpointtoseg(s2[1,],s1),distpointtoseg(s1[4=2){s2}else{s1}
p=rbind(s1,s2)[1,]
points(x=p[1],y=p[2],col="red",cex=2)</pre>
```

dist_areas_f 5

```
points(projpointonseg(p,s)[1],projpointonseg(p,s)[2],col="red",cex=2)\\ segments(x0 = p[1],y0=p[2],x1=projpointonseg(p,s)[1],y1=projpointonseg(p,s)[2],lty=3)\}\}\\ par(mfrow=c(3,3))\\ set.seed(3);replicate(9,zz())
```

dist_areas_f

Distances between hexagonal bins

Description

Distances between hexagonal bins

Usage

```
dist_areas_f(
   U,
   delta = (range(U$x)[2] - range(U$x)[1])/100,
   h = neighbourhoods(U, delta)
)
```

Arguments

U : a dataframe containing the numerical variables x and y and preferable hexagon

delta : needed if hexagon is not a variable of U: bins will be recomputed

Value

a named matrix

```
data(U)
dist_areas_f(U)

delta<-0.01
h<-neighbourhoods(U,delta)
U$hexagon<-paste0(h@cID)
hD<-dist_areas_f(U,h)

sss1=sample(nrow(U),1000)
sss2=sample(nrow(U),1000)
x=sapply(1:1000,function(i){dist(U[c(sss1[i],sss2[i]),c("x","y")])})
y<-sapply(1:1000,function(i){hD[U$hexagon[sss1[i]],U$hexagon[sss2[i]]]})
plot(x,y,pch=".")</pre>
```

6 Generate_U

Generate_U

Generate spatial data that matches population counts

Description

Generate spatial data that matches population counts

Usage

```
Generate_U(SpatialData, .id = NULL, .spatialobject, type = "random")
```

Arguments

SpatialData : an object of class that includes

type : argument to be passed to sp::spsample

```
data(parish110217popest,package="dataONS")
data("mtcty150217population",package="dataONS")
shapeData2<-dataONS::dataParishes_December_2011_Boundaries_EW_BFC()</pre>
yy<-unique(get(data(Output_Area_to_Parish_to_Local_Authority_District_December_2011_Lookup_in_England_and_Wale
names(yy)<-tolower(names(yy))</pre>
shapeData<-sp::merge(shapeData2,yy,by="par11cd",duplicateGeoms = TRUE)</pre>
parish110217popest2<-parish110217popest[</pre>
is.element(parish110217popest$PAR11CD,
             shapeData$par11cd)&
                 parish110217popest$year=="mid_2006",
                    c("PAR11CD", "Population")]
                    names(parish110217popest2)<-tolower(names(parish110217popest2))</pre>
             shapeData=sp::merge(shapeData,parish110217popest2,by="par11cd",duplicateGeoms = TRUE)
             shapeData$population[is.na(shapeData$population)]<-mean(shapeData$population,na.rm=TRUE)</pre>
             shapeData<-subset(shapeData,is.element(lad11nm,c("Allerdale", "Barrow-in-Furness", "Carlisle", "C</pre>
popbins<-quantile(shapeData$population,(seq_len(11)-1)/10)</pre>
poppal <- colorBin(heat.colors(5), bins=popbins, na.color = "#aaff56",reverse = T)</pre>
library(leaflet)
leaflet(U) %>%
 addPolygons(data=shapeData,
             stroke=TRUE,
             weight=1,
              color="black",
              fillOpacity=5,
              fillColor=~poppal(shapeData$population)) %>%
 addTiles() %>%
 addLegend(title = "Population count", pal=poppal,
            values=shapeData$population,
```

neighbourhoods 7

```
opacity=1,
na.label = "Not Available")
```

neighbourhoods

hexagonal bins

Description

hexagonal bins

Usage

```
neighbourhoods(
   U,
   delta = (range(U$x, na.rm = TRUE)[2] - range(U$x, na.rm = TRUE)[1])/100
)
```

Arguments

U : a dataframe containing the numerical variables x and y

delta: controls the bin diameter

Value

a hexbin object hexagonal bins

Examples

```
# plot the hex bins of cumbria
data(U)
plot(neighbourhoods(U,.1))
plot(neighbourhoods(U,.01))
plot(neighbourhoods(U,.001))
```

newdist

compute distances between new infected and exposed

Description

@param closedistances NULL, or a named list with 2 named elements: closedistances\$ra, closedistances\$id @param U a data.frame with the variables hexagon (can be any bin identifier), x, y: coordinates, @param sicks @param new.sicks @param delta a positive number: a threshold @param dist_areas: a function between @return NULL, or a named list with 2 named elements: closedistances\$ra, closedistances\$id

8 projpointonseg

Usage

```
newdist(
  closedistances = NULL,
  U,
  sicks,
  new.sicks = NULL,
  delta = 0.005,
  dist_areas = dist_areas_f(U, delta)
)
```

Examples

```
delta<-.005
sicks<-(1:nrow(U))[y=="sick"]
closedistances=newdist(NULL,U,sicks)</pre>
```

projpointonseg

computes the position of a projected point in the basis formed by a segment

Description

computes the position of a projected point in the basis formed by a segment

Usage

```
projpointonseg(p, s)
```

Arguments

p a numeric vector of length 2

s a 2x2 numeric matrix, representing a segment. Each row of the matrix are the coordinates of a extreme point of the segment.

projpointonseg_a 9

projpointonseg_a computes the position of a projected point in the basis formed by a segment

Description

computes the position of a projected point in the basis formed by a segment

Usage

```
projpointonseg_a(p, s)
```

Arguments

p a numeric vector of length 2

s a 2x2 numeric matrix, representing a segment. Each row of the matrix are the coordinates of a extreme point of the segment.

```
data(Avo_fields,package="Strategy")
polygon1<-Avo_fields[1,]</pre>
A<-polygon1@polygons
B<-A[[1]]@Polygons[[1]]@coords
i=sample(nrow(B)-1,1)
s<-B[i:(i+1),]
p<-c(runif(1,min = 142.162,max=142.165),runif(1,min=-34.171,max=-34.167))
plot(B, type='l')
points(s,type="1",lwd=4,col="red")
points(x=p[1],y=p[2] ,col="red",cex=2)
points(projpointonseg(p,s)[1],projpointonseg(p,s)[2],col="red",cex=2)
segments(x\emptyset = p[1],y0=p[2],x1=projpointonseg(p,s)[1],y1=projpointonseg(p,s)[2])
projpointonseg_a(p,s)
distpointtoseg(p,s)
dist(rbind(p,projpointonseg(p,s)))
zz<-function(p){</pre>
s=matrix(c(0,1,0,0),2,2)
plot(s, type="l", xlim=c(-.5, 1.5))
points(x=p[1],y=p[2] ,col="red",cex=2)
points(projpointonseg(p,s)[1],projpointonseg(p,s)[2],col="red",cex=2)\\
segments(x0 = p[1], y0=p[2], x1=projpointonseg(p,s)[1], y1=projpointonseg(p,s)[2], col="red")
text(projpointonseg_a(p,s),-.8,paste0("a=",projpointonseg_a(p,s)))}
par(mfrow=c(2,2))
zz(c(-.5,1))
zz(0:1)
zz(c(.5,1))
zz(c(1.5,1))
```

risktobeinfected

Computes the risk to be infected

Description

Computes the risk to be infected

Usage

```
risktobeinfected(
   U,
   closedistances = NULL,
   sicks,
   new.sicks = NULL,
   .distriskhalf = 5 * 10^(-4),
   jumprisk = 10^-6,
   delta = 0.01,
   previouslyexposed = c(),
   previousrisk = numeric()
)
```

Examples

```
 y = rep("Sane", nrow(U)); y [sample(length(y), 10)] < -"sick" jumprisk = 10^-6 . distrisk half = 10^-6
```

risk to be in fected by distance to all in fected unit

Risk to be infected by many neighbours a neighbour at a certain distance

Description

Risk to be infected by many neighbours a neighbour at a certain distance

Usage

```
risktobeinfectedbydistancetoallinfectedunit(
   .dist,
   nI,
   .distriskhalf = 5 * 10^(-4),
   jumprisk = 10^-6
)
```

Arguments

.dist : a vector (distances)

.disthalfrisk : distance for which the risk is one half

nI: total number of infected

jumprisk: probability to be infected by one person, no matter how far he(she) is

Value

1-(prod(1-risktobeinfectedbydistancetooneinfectedunit(.dist,.distriskhalf))*(1-jumprisk)^nI)

Examples

```
\#Risk to be ingfected 2 m from the victim when the 50%risk distance is 1 m: risktobeinfectedbydistancetooneinfectedunit(2,1)
```

 $\verb|risktobe| infected by distance to one infected unit|\\$

Risk to be infected by a neighbour at a distance x

Description

Risk to be infected by a neighbour at a distance x

Usage

```
risktobeinfectedbydistancetooneinfectedunit(.dist, .distriskhalf = 5 * 10^(-4))
```

Arguments

.dist : a distance

. disthalfrisk : distance for which the risk is one half

Value

```
exp(-.dist/(log(2)*.distriskhalf))
```

```
\#Risk to be ingfected 2 m from the victim when the 50%risk distance is 1 m: risktobeinfectedbydistancetooneinfectedunit(2,1)
```

12 test

segment.intersect

computes the orientation of a triangle

Description

computes the orientation of a triangle

Usage

```
segment.intersect(s1, s2)
```

Arguments

a 2x2 numeric matrix, representing a segment. Each row of the matrix are the

coordinates of an extreme point of the segment.

a 2x2 numeric matrix, representing a segment. Each row of the matrix are the

coordinates of an extreme point of the segment.

Examples

```
zz<-function(){
s1=matrix(sample(0:2,4,rep=T),2,2)
s2=matrix(sample(0:2,4,rep=T),2,2)
si<-segment.intersect(s1,s2)
s<-rbind(s1,s2)
plot(s,cex=.5,main=if(si){"Intersect"}else{"Disjoint"})
points(s1,type="1")
points(s2,type="1")
text(s[,1],s[,2],toupper(letters[1:4]),cex=2,col="red")
}
par(mfrow=c(3,3))
set.seed(1);replicate(9,zz())</pre>
```

test

runCompare

Description

Shiny App to

Usage

test()

triangleorientation 13

Examples

```
package1<-NULL
package2<-NULL
runCompare()</pre>
```

triangleorientation

computes the orientation of a triangle

Description

computes the orientation of a triangle

Usage

```
triangleorientation(s)
```

Arguments

s

a 3x2 numeric matrix, representing a triangle. Each row of the matrix are the coordinates of an extreme point of the triangle.

Examples

```
zz<-function(p){
s=matrix(sample(0:2,6,rep=T),3,2)
plot(s[c(1:3,1),],type="l",main=(if(triangleorientation(s)==1){"+"}else{if(triangleorientation(s)==-1){"-"}els
text(s[,1],s[,2],toupper(letters[1:3]),cex=2,col="red")
}
par(mfrow=c(3,3))
replicate(9,zz(c(sample(-2:3,1),sample(-2:2,1))))</pre>
```

updatedist

update the list of the already nown distances between subjects with distances between new infected and exposed

Description

@param closedistances NULL, or a named list with 2 named elements: closedistances\$ra, closedistances\$id @param U a data.frame with the variables hexagon (can be any bin identifier), x, y: coordinates, @param sicks @param new.sicks @param delta a positive number: a threshold @param dist_areas: a function between @return NULL, or a named list with 2 named elements: closedistances\$ra, closedistances\$id

14 updatedist

Usage

```
updatedist(
  closedistances = NULL,
  U,
  sicks,
  new.sicks = NULL,
  delta = 0.005,
   dist_areas = dist_areas_f(U, delta)
)
```

```
delta<-.005
sicks<-(1:nrow(U))[y=="sick"]
closedistances=newdist(NULL,U,sicks)</pre>
```
